

I would be profoundly honored should Your Excellency graciously accord this document a thorough and considerate reading in its entirety.

The ideas for innovation are presented on page 46, with seven additional points (+11page).

Message to His Royal Highness the Grand Duke of Luxembourg – Page 47

It has been structured in such a manner that the entirety may be delivered within approximately ten minutes.

Je précise que la traduction ainsi que certaines informations complémentaires (par exemple : des données relatives au Luxembourg) ont bénéficié de l'assistance de ChatGPT, mais que l'ensemble du contenu constitue intégralement une œuvre de ma propre création. Je vous prie de bien vouloir noter qu'une lecture attentive de l'ensemble requiert environ trente minutes.

L'utilisation de l'intelligence artificielle à titre d'outil auxiliaire ne change ni la philosophie ni la pensée qui la guide

Je connais une méthode permettant de résoudre structurellement les problèmes d'alimentation, d'eau potable et de combustible en Afrique. Ce que j'avance n'est nullement une exagération.

Permettez-moi, tout d'abord, de vous exposer une approche capable de réduire considérablement les massacres en contournant les réseaux de surveillance au sein des sociétés africaines.

Le coût opérationnel n'excède 10 à 20 dollars par déploiement, tout en offrant une précision comparable à celle d'un satellite de renseignement. Je vous prie de ne pas me considérer comme un interlocuteur inutile et de bien vouloir lire ce message jusqu'au bout.

Je suis, pour ainsi dire, un esprit dissident— non pas dans le sens de la provocation, mais dans celui d'une personne capable d'imaginer ce que d'autres n'osent même pas concevoir.

Celui qui parvient à unir la technologie, l'éthique, la diplomatie, l'humanisme et la philosophie personnelle en une seule vision est, par nature, un esprit dissident.

Artificial intelligence must remain simple. Only through such simplicity can it operate on discarded smartphones powered by solar panels, enabling even the most resource-constrained communities and NGO field staff to learn and deploy it intuitively.

For AI to truly serve local communities, it must be operable even by students. In practice, the most valuable form of AI is that which can be employed, however modestly, not only on smartphones but on any available device—even in environments entirely devoid of electricity.

NGOs are not software developers; the reasoning behind statistical outputs must be readily understandable, even from annotations in the code itself. The simpler the structure, the easier it becomes to analyze and verify.

A truly simple form of AI can be powered by nothing more than a two- or three-dollar solar cell and can operate across a range of modest electronic devices. Yet within such simplicity lies the profound capacity to safeguard—and indeed to save—countless lives.

Indicators such as food and medical supply needs, or the mapping of areas vulnerable to abduction and trafficking, should be expressed not as exact figures but as ranges (e.g., “*between 100,000 and 130,000 supported*” or “*a zone within a 2–5 km radius*”). Excessive precision increases the risk of re-identification and may run counter to the spirit of the GDPR.

Accordingly, we report through privacy-preserving forms—ranges, grids, and heat maps—and ensure that all alerts and estimations are governed by explainable rules and continuously refined through feedback.

In this same vein, even ESG-based international ethical reporting must not rely upon artificially precise numbers, but should instead present carefully defined ranges, thereby upholding both transparency and privacy.

Dear Ambassador, In artificial intelligence, what truly matters is not programming skills, but the underlying purpose and values.

What is ultimately decisive in the realm of artificial intelligence is not the mere process by which it has been engineered, but rather the vision and purpose to which it is devoted. When its direction is anchored in noble intent, the very finest minds in the global AI community are inclined to lend their expertise freely, in the spirit of service to humanity.

This dynamic reveals the true strength of what may be termed *Honorable AI*: a model whose ethical foundation transforms it from a technical instrument into a vehicle of international recognition, cooperation, and trust. Such an approach does not merely advance innovation; it generates profound diplomatic capital—enhancing the prestige of the nation that stewards it, and positioning that nation at the forefront of global ethical leadership.

Your Excellency, Ambassador Jacques Flies,

It is indeed possible for an AI system of great humanitarian value to operate with nothing more than a two- or three-dollar solar cell and the most basic electronic devices.

When combined with the Bluetooth functions already present in smartphones, together with their built-in sensors (accelerometer, gyroscope, proximity, ambient light, magnetometer, and GPS), such an AI can hold the power to save lives in circumstances where resources are most scarce. The potential applications are far-reaching.

I humbly submit that Luxembourg could, if it so chooses, employ this model as a distinctive instrument of diplomacy. Deployed across low-income countries and rural communities in Africa, such an initiative would not only provide direct relief but also demonstrate Luxembourg's leadership in championing ethical innovation.

An Ethical AI of this nature could stand as a remarkable expression of Luxembourg's soft power—"Made in Luxembourg," not as a commercial brand, but as a beacon of integrity and service to humanity. Its potential should not be overlooked.

Above all, simplicity is the true strength of this model. For when AI becomes overly complex, it not only risks hallucination but also becomes less accessible and less trustworthy. By keeping it simple, transparent, and accountable, Luxembourg has the opportunity to present to the world an AI that uplifts, rather than exploits.

Excellencies, It must be recognized that vast and overly complex forms of artificial intelligence cannot be employed in low-income households, impoverished communities, or regions where electricity itself is scarce. What truly matters is to instill within the most vulnerable not only the means of access, but also the confidence and dignity that accompany the ability to engage with such technology.

If AI is monopolized solely by the great powers, it will inevitably give rise to new inequalities of information—an outcome which runs fundamentally contrary to the very purpose and promise of artificial intelligence.

**With the highest respect,
Gyu-min Jeon**

With your kind permission, I would like to begin by outlining the research dimension of this initiative — both in its academic and humanitarian aspects — as it pertains to potential collaboration between the University of Luxembourg and leading universities in the Republic of Korea.

Your Excellency, among Korea's most distinguished institutions of higher learning stands the Korea Advanced Institute of Science and Technology (KAIST), a university internationally recognized for its excellence in research and innovation.

The initial amount I mentioned — one thousand dollars — represents a personal contribution from my own resources. While this modest sum is sufficient to demonstrate the feasibility of a pilot or concept study, it cannot realistically support an academic exchange of formal standing. At such a stage, discussions can only remain within the realm of potential and possibility, rather than implementation.

For a structured academic partnership between the University of Luxembourg and KAIST to be properly realized, an estimated research budget of approximately one hundred thousand dollars would be required. It is encouraging to note that KAIST has expressed strong enthusiasm for international cooperation and welcomes research-based collaboration with global partners.

My own role, as I see it, would be to develop and provide ethically grounded and humanitarian research themes for students, fostering a sense of responsibility and purpose aligned with international development principles. However, for an academic exchange of this nature to take formal shape, it would be essential that such dialogue be initiated under Your Excellency's gracious auspices.

At this stage, allow me to present what may be regarded as the MVP — the Minimum Viable Product — of the initiative. It has been deliberately conceived in such a manner that failure is structurally precluded.

In many low-income and developing regions, access to electricity remains severely limited, and night-time activity often entails considerable risk, particularly for women and children. A solar-powered flashlight, therefore, is not a mere convenience but an ethical necessity — a fundamental instrument of safety and dignity.

Building upon this essential foundation, the model integrates a lightweight and locally adaptable form of artificial intelligence, designed specifically for contexts where infrastructure is fragile and resources are scarce.

This configuration ensures that the technology is not only practical but also morally sound — a design that, by its very nature, cannot fail in its humanitarian purpose.

Briefing Note – Embassy of Luxembourg in Seoul

1. Purpose of the Presentation

The essence of my presentation today is to demonstrate how this initiative can go beyond technical cooperation to propose a new international standard for ethical AI. In particular, I wish to highlight the potential for academic collaboration and diplomatic achievement through an internship and exchange program between the University of Luxembourg and KAIST, one of Korea's premier institutions.

2. Project Overview

(1) Problem Recognition

In low-income countries and refugee camps, child abduction and the spread of infectious diseases remain grave human rights concerns.

Many NGOs face donor imbalance due to the absence of transparent performance metrics.

In the ESG and CSR era, corporations and donors increasingly demand verifiable, quantified data aligned with international reporting standards.

(2) Proposed Solution

A flashlight-based lightweight AI is proposed. In communities lacking electricity, flashlights are not only indispensable tools but also protective devices against child abduction.

Because such incidents often occur in darkness or secluded areas, an AI-enabled flashlight offers direct preventive value.

Residents can report urgent needs—food, medicine, or danger—through a simple, solar-powered, Bluetooth-based, serverless AI system.

The system generates quantified ESG/CSR data that can be automatically transformed into international-standard reports.

Example: “USD 5,000 in support → 3,000 residents safeguarded.”

Corporations can integrate these outputs into GRI, UNGC, and SDG reporting frameworks.

(3) Strategic Advantages for Luxembourg

Leadership in development cooperation: Linking refugee and child protection agendas with cutting-edge AI.

Leverage of impact finance: Providing ESG data directly connectable to Luxembourg’s financial hub.

Symbolic diplomatic value: Presenting a “Luxembourg–Korea Joint Ethical AI Standard” would significantly elevate Luxembourg’s visibility and influence in the international arena.

(4) Implementation Roadmap

Within 6 months: Pilot deployment in refugee camps or low-income communities.

Within 1 year: Launch of an NGO–corporate matching platform, targeting participation of 200 NGOs.

(5) Expected Outcomes

Child abduction prevention: Establishing first-line protection through AI-enabled flashlights.

Rational resource allocation: Data-driven distribution of food and medicine.

Epidemic response: Early warning capacity for emerging diseases such as Nipah virus.

Strengthened bilateral ties: Advancing joint research and diplomatic cooperation between Korea and Luxembourg.

ESG/CSR investment attraction: Offering international finance a credible, verifiable, and innovative reporting model.

3. Concluding Statement

“Ethical AI represents a new model of human protection, uniting simplicity, low cost, and strict adherence to international norms. Should Luxembourg and Korea jointly present an international standard for ethical AI, it would deliver not only technological collaboration but also a profound and symbolic message to the global community. I stand fully committed to ensuring that ethics are realized through concrete action.”

4. Anticipated Q&A

Q1. Is this project truly feasible?

A: Yes. A pilot MVP can be deployed within 6 months in refugee camps. Its solar-powered, Bluetooth-based lightweight structure ensures minimal barriers to execution. University of Luxembourg and KAIST students are well equipped to implement it, generating both academic exchange and diplomatic value.

Q2. What are the tangible diplomatic benefits for Luxembourg?

A: The initial MVP can be realized with USD 5,000–10,000. However, to secure international credibility and sustained university collaboration, a baseline of USD 100,000 is recommended.

Q3. How will long-term sustainability be assured?

A: As corporations voluntarily employ the system for ESG reporting, ongoing market demand will sustain operations. This ensures independence without reliance on government subsidies.

Why an AI Flashlight? 11 Reasons

1. A flashlight is one of the most widely used relief items in regions with limited electricity, refugee camps, and low-income communities.

2. As an already essential tool, the concept of an “AI flashlight” is easy for people to understand and accept.

3. A simple household object can be transformed into a multi-layered instrument for child protection, crime prevention, and emergency reporting—giving it strong symbolic value.
4. With solar charging, a Bluetooth module, and lightweight offline AI code, the flashlight provides a structurally simple platform where components can be integrated easily.
5. It consumes very little power, making battery life far less of a concern.
6. Compared with smartphones or wearables, developing an MVP in flashlight form is technically easier and significantly less costly.
7. Communities are already familiar with flashlights, so little to no training is required for their use.
8. Carrying a flashlight is a natural behavior and does not carry stigma.
9. For NGOs and donors, it serves as a tangible, visible outcome that is easy to explain and showcase.
10. The idea of an “AI flashlight” is simple yet carries very strong communicative power in diplomatic and international discussions.
11. For reporting purposes, it allows straightforward quantification and storytelling—for example: “5,000 flashlights distributed → 10,000 children protected.”

Research Collaboration between the University of Luxembourg and KAIST

1. The initial MVP (Minimum Viable Product) requires only a modest investment, which is minimal by the standards of international development projects.
2. The potential outcome carries exceptional symbolic weight, as it would constitute the world’s first Ethical AI Flashlight, with considerable visibility and recognition in international media.
3. The project will immediately generate transparent ESG data, making it directly relevant to Luxembourg’s broader strategies in finance and development cooperation.
4. The technical complexity is not excessive; it is well within the capacity of students and academic researchers, ensuring feasibility while fostering meaningful academic engagement.
5. The Ethical AI Flashlight is particularly valuable in regions where security is fragile, as it provides both protection and reassurance for vulnerable communities. Its lightweight and scalable design also makes it well-suited as

an innovation pilot, and could be further developed as a social impact venture.

The AI Flashlight will serve as a vital first line of defense in regions where security remains fragile, helping to deter abductions of children as well as the kidnapping and assault of women.

Your Excellency,

From this point onward, the following section outlines how this ethical and public-interest initiative may evolve into a broader framework of sustainable development and academic collaboration.

It does not conclude with the presentation of the MVP; rather, it advances a long-term vision — one that seeks to foster continued technological and scholarly exchange between the University of Luxembourg and leading universities in the Republic of Korea.

The ultimate aspiration is to establish a model in which ethical innovation serves as both an academic bridge and a humanitarian instrument — a partnership that unites European and Korean institutions in the pursuit of responsible progress for the global common good.

ESG International Ethical Report (Example)

Project Title: Humanitarian Support through Ethical AI

Reporting Entity: M-Corp Ethical AI Initiative

Reporting Period: January 1 – June 30, 2025

Supported Country/Region: Rural Communities in Sub-Saharan Africa

Total Contribution: USD 100,000

1. Beneficiaries

The initiative reached an estimated 5,000 to 7,000 individuals, based on AI-generated calculations.

Primary beneficiary groups included refugee children, children with disabilities, and low-income households.

2. Delivered Outcomes

A total of 15 metric tons of staple food were distributed to target communities. Two thousand essential medical kits were delivered to improve local healthcare access.

One thousand five hundred households received hygiene and daily-use supplies.

Local NGOs conducted 25 community-based training sessions to strengthen social resilience.

3. Social Impact

Child malnutrition rates declined by approximately 12 percent within the target areas.

Access to primary healthcare services improved by nearly 18 percent following medical kit distribution.

Reported cases of insecurity and child endangerment fell by 9 percent.

Local NGO capacity was significantly enhanced, enabling sustainable, community-led service delivery.

4. Alignment with the UN Sustainable Development Goals (SDGs)

The project directly supported the following goals:

SDG 3 – Good Health and Well-being

SDG 10 – Reduced Inequalities

SDG 16 – Peace, Justice and Strong Institutions

SDG 17 – Partnerships for the Goals

5. ESG Indicators

Social: Verified support for vulnerable populations, with over 65 percent of beneficiaries being women and children.

Governance: Full compliance with GDPR, UNCRC, CRPD, and EU AI Act standards ensured.

Environmental: All operations powered by portable solar units, with minimized use of plastic and packaging materials.

6. Transparency and Verification

Field data were compiled from local NGO reports and cross-verified through AI-assisted aggregation.

Independent oversight was conducted by regional partners, supplemented by third-party compliance reviews.

All collected data were anonymized and securely erasable, guaranteeing full privacy protection and zero data retention risk.

7. Remarks

This initiative demonstrates how ethical AI-based reporting can strengthen transparency and accountability in humanitarian action.

Through modest yet strategically allocated resources, the project achieved measurable and verifiable impact among thousands of vulnerable individuals.

At the same time, it enabled both corporate and governmental partners to substantiate credible ESG and CSR contributions, fully aligned with global ethical and sustainability frameworks.

Quantified ESG International Ethical Standard Report

Safeguarding against counterfeit ESG claims by means of the M-Corp certification mark and an immutable blockchain address

The quantification of ethical compliance into internationally standardized reports will be fully automated through AI.

By design, such reports exclude subjective interpretation, thereby ensuring their credibility as trusted instruments aligned with global standards.

In essence, this approach enables the realization of transparent and impartial ESG reporting—free from undue lobbying or external influence.

M-Corp, headquartered in Luxembourg, will enable international organizations and ESG funds to review ethical reports online with ease.

This, in turn, will facilitate more informed investment decisions while allowing the ethical standing of companies to be assessed with greater objectivity through quantified indicators.

Luxembourg will establish itself as the international standard for Quantified ESG International Ethical Reporting.

An equitable system of international ethical reporting opens the way for not only large NGOs but also emerging and smaller organizations to receive corporate sponsorship on fair and transparent terms.

Even large NGOs often find themselves withdrawing from local regions. In such cases, it becomes essential to establish self-reliant, community-based NGOs that can sustain their presence and continue providing support on the ground.

Large NGOs may also register local partner NGOs with M-Corp, enabling them to receive sponsorship.

I firmly believe that many of the world's most innovative and life-saving ideas are to be found within emerging and smaller NGOs. Yet, until now, such organizations have often been compelled to devote substantial resources to self-promotion and visibility campaigns.

If these burdensome costs can be reduced, I am convinced that a far greater share of resources could be directed toward assisting the most vulnerable populations, thereby multiplying the impact of humanitarian action.

What corporations truly seek when sponsoring an NGO is a standardized ESG International Ethical Report. With M-Corp AI, this process becomes seamless: a company simply selects the ESG areas it wishes to prioritize,

and the system automatically matches it with the most suitable NGO.

The NGO, in turn, uses M-Corp AI to submit quantified data in numerical form, which is then processed into a transparent, internationally standardized ethical report.

The result is an automated ESG report delivered directly to the sponsoring corporation—credible, comparable, and aligned with global standards.

All of these outcomes may be realized through lightweight AI, requiring only minimal expenditure for development and sustaining ongoing maintenance at the lowest possible cost. Yet, the diplomatic influence thereby generated will be of the highest and most distinguished order.

Let us assume, by way of illustration, that a corporation commits a sponsorship package of USD 10 million. Each participating NGO would register its funding requirements and specific budgetary allocations through the M-Corp platform. The system would then introduce the corporation to a range of eligible NGOs, thereby enabling the company to distribute its sponsorship across multiple partners in accordance with its own priorities.

The corporation, in turn, retains full discretion to decide whether to receive a single consolidated ESG International Ethical Report or separate reports for each NGO it supports.

All reporting data are securely recorded within the M-Corp system, where they remain accessible not only to the sponsoring corporation but also to ESG funds, international organizations, and United Nations bodies. In this way, the ethical standing of corporations may be verified with ease—expressed transparently through charts and quantified indicators, and benchmarked against recognized global standards.

M-Corp sustains its operations by charging a modest 1% facilitation fee, which is directed to joint AI research funds between the University of Luxembourg and partner universities in the Republic of Korea, as well as to cover M-Corp's own operating costs.

Crucially, this structure ensures that no additional budgetary allocation from the Government of Luxembourg is required. M-Corp thus remains a self-sustaining system, headquartered in Luxembourg, yet operating with global reach and credibility.

As a result, corporations worldwide, alongside international organizations, NGOs, and philanthropic entities, will necessarily enter into ESG/CSR cooperation agreements through Luxembourg. The diplomatic and strategic influence accruing to Luxembourg from this arrangement will be both profound and enduring.

By contrast, commercial AI models pursued in the United States, China, and

elsewhere—predicated upon exploitative data extraction—have often

generated unemployment, heightened privacy risks, and required unsustainable levels of funding for maintenance. Such models, far from being universally welcomed, face increasing skepticism in the international community.

M-Corp AI, by comparison, represents an ethical paradigm: a lightweight, cost-efficient, and rights-based system that is welcomed by all. With Luxembourg as its hub, it will establish itself as the world's foremost sanctuary of Ethical AI. The blueprint is already in place—what remains is simply its implementation.

Commercial forms of AI—often associated with privacy intrusions, data exploitation, and the exacerbation of social inequalities—are being met with growing caution within the international community. Far from strengthening diplomatic influence, they increasingly serve to diminish it. By contrast, Ethical AI is universally welcomed, for it safeguards rights, fosters trust, and thereby significantly enhances diplomatic standing. With the utmost conviction, I affirm that Luxembourg is destined to establish itself as the world's foremost leader in the realm of Ethical AI.

In conclusion,

“Luxembourg stands as a global sanctuary of philanthropy.”

While individuals have no inherent need for formal ethical reports, the reality of the social media era is that there exists a powerful global impulse to demonstrate one's moral integrity and good deeds. Many people across the world would welcome the opportunity to hold a blockchain-based certificate of honor as a symbolic proof of their contribution to the common good.

Should this framework expand beyond corporations to include individual sponsors, it would present a genuine opportunity to address the chronic funding shortages that NGOs so often face. By institutionalizing personal participation, the model creates a new pathway: *ethical action demonstrated* → *certificate of honor issued* → *increased philanthropic engagement*.

Such a virtuous cycle holds both diplomatic and social resonance. It affirms that Ethical AI is not only a tool for corporate accountability, but also a universally accessible model embraced by citizens worldwide—thereby transforming global humanitarian financing into a more inclusive and sustainable endeavor.

For corporate use, ethical certificates must, by deliberate design, remain quantified and austere, thereby ensuring credibility and comparability across markets. By contrast, for individuals, the very purpose of an ethical certificate lies in recognition and social visibility.

Accordingly, personal certificates are best conceived in a visually distinguished manner—issued as NFTs, enhanced with gilded accents, and

readily suited for dissemination across social media platforms.

Moreover, should such certificates incorporate the works of emerging and lesser-known European artists—accompanied by their names alongside the artwork—they would not only provide much-needed financial support to creators whose livelihoods are precarious, but also elevate their visibility upon the global stage. In this way, the initiative would directly contribute to the advancement of several Sustainable Development Goals (SDGs):

[This AI platform also provides support to emerging and lesser-known European artists whose livelihoods are in urgent need of sustenance.](#)

- SDG 1: No Poverty – by sustaining the basic livelihoods of artists,
- SDG 10: Reduced Inequalities – by amplifying the voices of marginalized creators,
- SDG 16: Peace, Justice and Strong Institutions – by embedding transparency and recognition within ethical reporting,
- SDG 17: Partnerships for the Goals – by fostering synergies between technology, philanthropy, and the arts.

[Supporting emerging and lesser-known artists constitutes a vital process in advancing freedom and beauty across the world. Luxembourg, for its part, already possesses a highly developed ecosystem of funds, cultural foundations, and artistic support institutions—such as the Casino Luxembourg Forum for Contemporary Art and the Ministry of Culture’s grant mechanisms—which exemplify its enduring commitment to cultural patronage.](#)

According to Eurostat, more than seventy percent of all professionals engaged in the arts and entertainment sectors across the European Union are employed on a non-permanent or freelance basis. A considerable proportion of these individuals are unable to secure stable avenues for the sale of their works, with young and female artists in particular facing heightened vulnerability within this precarious landscape.

In this context, M-Corp advances a profoundly distinctive and innovative approach.

Under this framework, emerging and lesser-known artists contribute their works in the form of NFT-based art pieces, each embodying their unique aesthetic sensibility. Individual sponsors, in turn, are able to acquire these NFTs for a modest contribution of only five dollars.

The acquired artwork is then seamlessly integrated into a personalized Certificate of Honor, beautifully designed for social visibility, which sponsors may proudly share across their social media platforms. By way of illustration, should one hundred supporters acquire a single NFT, the artist would immediately receive five hundred dollars in direct remuneration.

Most importantly, M-Corp retains no commission whatsoever; the entire proceeds are transferred in full to the participating artist. In so doing, the model ensures not only a transparent and dignified mechanism of support but

also the cultivation of a natural and organic bond between emerging artists and individual global citizens who wish to contribute to the common good.

This initiative exemplifies how Ethical AI, cultural innovation, and philanthropic engagement may converge in a manner that is both equitable and resonant, offering a dignified platform through which the creativity of vulnerable artists is sustained while individual sponsors are empowered to participate in a visible, meaningful, and socially celebrated act of generosity.

Such an approach would not only further consolidate Luxembourg's image as a sanctuary of philanthropy, but also demonstrate how Ethical AI and artistic innovation may converge to create a model of recognition that is more inclusive, dignified, and resonant across the international community.

Supporting emerging and lesser-known artists constitutes, in essence, an act of cultural patronage—one that enables the ethical character of this AI to be more readily disseminated by word of mouth, while simultaneously showcasing Luxembourg's cultural magnanimity and generosity to the wider international community.

The design of the personal ethical report envisions, on its front page, a formal record of ethical contribution, while on the reverse it features an NFT artwork created by an emerging artist.

Alongside the artwork, the artist's name, social media address, and PayPal sponsorship link may be included. In this way, countless individuals will come to recognize and support such artists, enabling them to sustain their livelihoods and pursue their creative vocation rather than abandon it.

On the Scale of Prospective Sponsorship (Estimates)

With respect to the anticipated sponsorship capacity of the M-Corp initiative (Quantified ESG International Ethical Report), a conservative projection already exceeds USD 10 billion annually.

This is not a subjective figure arbitrarily advanced; rather, it reflects the undeniable trajectory of the international community—particularly the European Union—in which the accelerating climate crisis is expected to intensify demands for more rigorous ESG and CSR commitments across both corporate and philanthropic domains.

At present, the scale of ESG finance itself illustrates this dynamic. Sustainable open-end funds and ETFs alone are conservatively valued at USD 3.5 trillion globally. By contrast, the broader category of ESG assets (inclusive of institutional mandates and entrusted portfolios) is vastly greater: Bloomberg Intelligence reported that the global tally had already exceeded USD 30 trillion in 2022, with projections surpassing USD 40 trillion by 2030.

Luxembourg, as the foremost domicile of European fund vehicles, continues to embody this global movement, with ESG-related UCITS funds alone amounting to approximately EUR 3.25 trillion in assets under management.

Given that climate pressures are certain to escalate—bringing with them increased displacement, heightened food insecurity, and deepening poverty across Africa and other vulnerable regions—the likelihood is strong that the international community will demand even more stringent ESG/CSR engagement in the years ahead.

Accordingly, when both corporate and individual certificates under the M-Corp framework are taken together, an annual sponsorship volume conservatively surpassing USD 10 billion emerges as not only plausible but entirely reasonable within the broader global trajectory.

Diplomatic Exchange on Ethical AI between Luxembourg and the Republic of Korea

At present, the M-Corp facilitation model operates at a 1% fee. Yet, given that this is by nature a unique and indispensable international framework, the structure could reasonably be expanded up to a maximum of 5%.

The revenues generated would not be directed toward profit, but rather reinvested into operations and into joint initiatives between the University of Luxembourg and partner universities in the Republic of Korea. These would include collaborative AI research, internship exchanges, scholarship programs for emerging AI talent, and support for student-led start-ups.

In this way, young researchers from Luxembourg and Korea would be able to work side by side in advancing an Ethical AI paradigm.

I hold a firm conviction that by pursuing an Ethical AI model—distinct from the commercially exploitative trajectories seen in the United States and China—Luxembourg will not only secure technological credibility, but also profoundly strengthen its diplomatic influence on the global stage.

As previously noted, the intellectual property rights and copyrights would be formally vested in Luxembourg, while the MCorpAI.org platform would remain under the symbolic custodianship of its founder.

I hold a firm conviction that my creative and ethical proposals may serve as a genuine catalyst for transformative change in our world. I harbor no personal ambition in this regard. What I have thus far presented represents only the visible tip of a much larger vision, and I am fully prepared to cede all associated intellectual property rights to Luxembourg.

In doing so, I wish to pay tribute to Luxembourg's standing as one of the foremost humanitarian and ethically principled nations in the world. I therefore do not hesitate, nor do I feel any reservation, in offering such rights without expectation of return, confident that they will be stewarded with integrity and for the greater good of the international community.

Votre Excellence,

Né en 1982, j'ai, au fil des années, poursuivi avec persévérance un parcours d'autodidacte, m'appliquant sans relâche à discipliner et à perfectionner mes propres capacités.

C'est avec la plus profonde humilité que j'aspire à assumer la responsabilité de gardien de l'initiative M-Corp, en m'y consacrant non pas pour un intérêt personnel, mais pour le bien commun de l'humanité tout entière. Mon vœu le plus sincère est qu'à travers cette mission, je puisse offrir une contribution durable et précieuse au service du monde.

Vers un partenariat académique et stratégique entre l'Université du Luxembourg et KAIST dans le domaine de l'Intelligence Artificielle éthique

La perspective d'un programme structuré de coopération académique entre l'Université du Luxembourg et l'Institut coréen des sciences et technologies avancées (KAIST) — comprenant échanges d'étudiants, stages internationaux et dispositifs de soutien à l'entrepreneuriat universitaire — représente une opportunité d'une portée stratégique exceptionnelle pour le Grand-Duché.

L'initiative M-Corp AI, fondée sur le concept novateur et inédit d'une Intelligence Artificielle éthique, possède une singularité qui la distingue des modèles commerciaux dominants. Conçue de manière modulaire et accessible, elle peut être développée et mise en œuvre par des étudiants de cycle universitaire, sans dépendre de structures coûteuses ni de ressources surdimensionnées.

En confiant à l'Université du Luxembourg la propriété intellectuelle liée à cette innovation, il deviendrait considérablement plus aisé d'établir des accords de coopération scientifique avec les plus grandes universités du monde. L'Union européenne, l'OCDE et l'UNESCO soulignent déjà la primauté des cadres normatifs centrés sur l'éthique et les droits humains. Dans ce contexte, un modèle **sobre, éthique et opérationnel sur le terrain** permettrait aux étudiants luxembourgeois de participer directement à des projets de développement à portée mondiale.

À travers un réseau académique international, le Luxembourg pourrait ainsi s'affirmer comme **pôle de référence en matière d'IA éthique**, renforçant son image de marque et son autorité morale sur la scène internationale. Ce positionnement, distinct des approches commerciales poursuivies par les États-Unis et la Chine, conférerait au Grand-Duché à la fois une crédibilité accrue au sein de l'UE et un atout diplomatique propre et original.

Il convient de souligner que si l'attraction directe des plus grands développeurs mondiaux demeure complexe, l'originalité du projet réside précisément dans sa capacité à susciter des **partenariats technologiques quasi gracieux**, motivés non par des intérêts financiers, mais par la quête

de reconnaissance et de prestige. Les experts internationaux, déjà comblés matériellement, voient dans une telle initiative l'opportunité d'associer leur savoir-faire à une entreprise éthique de portée historique.

En conséquence, une alliance entre l'Université du Luxembourg et KAIST, fondée sur la promotion d'une IA véritablement éthique, constituerait non seulement un jalon académique majeur, mais aussi un levier diplomatique d'une puissance rare, offrant au Luxembourg un rôle de **chef de file international** dans un domaine où l'autorité morale prévaut sur la seule puissance économique.

Veuillez agréer, Votre Excellence, l'expression de ma très haute considération.

Je vous prie d'agréer, Votre Excellence, l'expression de ma très haute considération.

the founder of M-Corp : *Gyu-min Jeon (Morgan J.)*

MCorpAI.org

M-Corp, in its abbreviated form, signifies the "Morgan J. Corporation," a framework conceived as an international system of corporate ethical certification.

I must underscore that my personal aspiration does not lie in the pursuit of honors or distinctions as ends in themselves. Rather, I regard every form of recognition—however modest—as a solemn reminder of the duty entrusted to me: namely, to dedicate such abilities as I possess wholly and without reserve to the service of the global common good.

It is in this spirit of humility that I seek to advance M-Corp—not as a vessel of personal ambition, but as an instrument through which greater transparency, fairness, and ethical accountability may be realized within the international community.

My deepest hope is that, through this endeavor, Luxembourg and its partners may demonstrate to the world that ethical innovation, when guided by principles of integrity, can generate not only technological credibility but also enduring diplomatic strength.

Thus, while I remain profoundly conscious of my own limitations, I am equally resolute in my conviction that M-Corp can serve as a meaningful catalyst for positive transformation—uniting diverse actors under a common standard of ethics, and channeling collective resources toward the protection of dignity, equity, and peace for all.

The following is for reference.

It is merely a note on innovation.

Early-Warning Sensor Network

This equipment could be highly useful to the African Union (AU).

The African Union (AU) seeks to reduce dependence on major powers and emphasizes Africa-led solutions.

Within the AU, the Continental Early Warning System (CEWS) is in operation; however, as it relies primarily on satellites and reporting networks, it has limited coverage in rural areas, mountainous regions, and remote conflict zones.

A low-cost, ultra-lightweight field sensor network could therefore serve as an attractive complement to the existing system.

If presented not as an “externally manufactured, high-cost device,” but rather as a structure that can be assembled and operated locally in collaboration with African youth, universities, and NGOs through technology transfer, it would also be seen as a politically positive signal.

That said, without the approval and cooperation of member state governments, it would be difficult for the AU to formally adopt such a system. Framing it as a low-cost, ground-level layer that reinforces the AU’s CEWS would make the case far more persuasive.

Diplomatic Impact Version

It must be emphasized that the cost-efficiency of this model is without precedent.

An individual Early-Warning Sensor Network unit requires an investment of only \$5,000, yet when base stations are strategically positioned and operated under a one-way coverage model, each unit is capable of monitoring an area with a radius of up to 25 kilometers.

In practical application, even if deployed selectively as localized sensor networks in high-risk zones, the architecture retains the theoretical capacity to achieve continent-wide coverage of Africa with approximately 1,000 units—representing a total investment of no more than \$5 million.

When set against the prohibitive costs of satellite deployments or large-scale surveillance infrastructure, this figure is nothing short of transformative. It demonstrates that, through innovation and technology transfer, Africa-led solutions can be realized at a fraction of the conventional expense, delivering both sovereignty and sustainability in early-warning capacity.

Even in the event that the initial cost estimate of USD 5 million were to increase two- or threefold (for example, to USD 10–20 million), the model would remain exceptionally cost-effective when compared with traditional international surveillance systems such as satellites, aerial platforms, or ground-based infrastructures.

Moreover, through technology transfer, the financial burden would be equitably distributed among NGOs, universities, and local communities. As a result, it is projected that the African Union would assume no more than approximately 30 percent of the overall expenditure.

Genocide Early-Warning through Low-Cost Embedded AI

In conclusion, allow me to highlight a potential application of this AI in one of the most urgent humanitarian contexts: the prevention of mass atrocities in fragile regions of Africa.

Traditional monitoring mechanisms for genocide rely primarily on satellites, large-scale investigative missions, and high-cost surveillance systems. While essential, such approaches are often limited in coverage and difficult to deploy in remote or resource-constrained settings.

By contrast, the proposed lightweight, solar-powered AI architecture is capable of functioning on virtually any electronic device. Through simple acoustic detection—such as the recognition of gunfire or mass crowd noises—combined with basic geolocation recording, it can serve as an early-warning tool for potential mass violence.

Deployed at scale, ultra-compact AI-enabled devices could be distributed by drones across high-risk areas. These devices, once activated, would autonomously log and store coordinates when unusual acoustic patterns are detected. Upon retrieval by drones or trusted local partners, the stored data would enable rapid verification and targeted monitoring of suspected atrocity zones.

This is not speculative fiction but a technically viable concept, designed to complement existing international monitoring efforts. By lowering costs and expanding coverage, such a system could provide the international community with a new layer of vigilance in areas where traditional surveillance cannot reach.

Feasibility of Drone-Triggered Coordinate Retrieval (First-line Response for Mass-atrocity Early Warning) **Early Warning for Mass Atrocities Using Exceptionally Low-Cost Embedded AI**

Principle — Highly feasible in principle.

When a drone approaches within range (hundreds of metres), it can establish a secure link (LoRa / Wi-Fi / BLE) with the device and receive encrypted event records, which the drone then relays.

LoRa = Optimal (low power, long range, stable)

Wi-Fi / BLE = Supportive role

Detection & Reporting.

The device can distinguish between sounds likely to be gunfire and those likely to be crowd noise, and transmit the result as a short text message. A lightweight on-device AI can produce this classification together with a confidence score (i.e., the probability that the sound is gunfire versus crowd noise), which the drone forwards.

Advantages.

- No need to recover devices physically.
- Minimal risk to personnel.
- Practical in areas without permanent network infrastructure.

Caveats & Operational Considerations.

- Drone flight paths and retrieval/communication operations must comply with local airspace rules and permissions.
- Drone operational costs and security risks must be taken into account.
- Measures for data security, device tamper-resistance, and false-positive mitigation should be included.

Follow-up procedure.

Coordinates and the transmitted classification (and its confidence score) can be reviewed immediately via the message payload, with ongoing drone sorties providing persistent observation to verify or refine the initial identification.

This is the most cost-effective approach and eliminates the need for personnel to enter hazardous areas. If implemented, this could be used for life-saving operations in disaster zones that are inaccessible to personnel. In other words, it would allow responders to confirm whether people are present in a disaster area without sending anyone in directly.

The core value of this AI lies in its potential use for life-saving operations. If further developed, it could also be applied in nuclear accidents—for both rescuing people and assessing the extent of radiation spread.

Considerations

- False positives/over-detection: Sole reliance on acoustic recognition may lead to misinterpretation of events; therefore, mechanisms for reliability calibration are required.
- Ethical safeguards: Measures must be in place to prevent military or surveillance misuse, ensuring that operations remain within established international norms.
- Legal and aviation regulations: Drone flights and data collection must comply with national regulations governing airspace and information security.

Alignment with the SDGs and International Norms: In particular, it is directly connected to *SDG 16 (Peace, Justice and Strong Institutions)*. The prevention of genocide and the establishment of early warning systems have long been pressing concerns for multilateral bodies such as the United Nations and the African Union.

The prevention of genocide and mass atrocities is a task jointly emphasized by both the United Nations and the African Union.

This is directly linked to the principle of the Responsibility to Protect (R2P).

The African Union established the Continental Early Warning System (CEWS) in 2002 as a central pillar of the African Peace and Security Architecture (APSA).

Its goal is to detect early signs of conflict, violence, and mass atrocities, and to enable preventive action before escalation. However, the system still faces significant limitations in terms of efficiency and field-level responsiveness.

The AU is therefore in urgent need of low-cost, scalable, and field-oriented solutions.

Early detection of genocide and attacks on civilians aligns precisely with the preventive intervention mandate of the AU Peace and Security Council (PSC).

This technology is not impossible to achieve; it is a technology that can be developed even through student-level research. It is feasible even at the level of student research because it is not about inventing something entirely new, but about integrating existing technologies into a unified application.

What makes this particularly attractive is that it is not a piece of “high-cost equipment built abroad,” but rather a structure that can be assembled and operated locally.

Because it is low-cost, local governments and NGOs can manage it independently, which directly reinforces sovereign autonomy.

Furthermore, the fact that it can be developed even at the level of youth or university research may be regarded in Africa as a powerful symbol of “technological self-reliance.”

The following is for reference only.

A detailed manual on how to build a remote, contact-free, immediate, field-level early-warning system.

Project overview

This plan aims to add a practical, cost-effective early-warning layer to vulnerable areas that are out of reach for conventional satellite and large-scale surveillance systems, by combining ultra-low-power embedded devices with a drone-based “instant early-warning” collection architecture. While technically feasible, the project requires prior local consent, government approval, robust security and evidence-management protocols, and independent ethical and legal review to establish legitimacy, safety, and legal acceptability. We recommend validating technical and ethical feasibility with a small pilot before scaling through multilateral cooperation.

Operational preconditions — the equipment should only be deployed if the answer to all five of the following questions is “yes”:

1. Is the target area lacking reliable, persistent communications infrastructure?
2. Is there a significant safety risk for people to enter the area?
3. Can legal/local approvals be obtained (or can you collaborate with allied NGOs or local authorities)?
4. Can you implement verification procedures to mitigate false positives (human verification or multi-sensor validation)?
5. Is there an operator responsible for recovery, maintenance, and security of the devices?

High-priority operational environments

- Remote or mountainous areas with no mobile or Internet coverage.
- Villages with unstable or no power supply.
- Conflict zones with active armed groups or militias.
- Areas near refugee camps at high risk for mass violence.
- Areas with absent public security (where police or state institutions cannot operate).
- High-risk “kidnap for ransom” tourist routes or scam compound areas where evidence collection is needed but law enforcement cannot be deployed.
- Post-disaster zones (earthquake, flood) that are inaccessible to search- and-rescue teams.

This is not a drone surveillance strategy. Prolonged drone loitering increases the risk of detection or shoot-down. Instead, drones rapidly deploy ultra-lightweight devices and withdraw; data collection is performed later by a drone passing nearby to retrieve stored records.

Technical summary and feasibility

The principal advantage of this approach is technology transferability and scalability. A drone-based flying–store-and-forward collection model combined with ultra-low-power embedded devices (small MCU, microphone, GPS, LoRa, small solar cell, battery, encryption) is technically implementable. However, safety, legal, ethical, and operational risks are considerable — deploying without concrete mitigation designs and procedures would be highly dangerous.

Concept of operations (summary)

- A single drone carries multiple ultra-lightweight devices (typically ten to twenty), disguised as “pebbles,” and drops them over the target area. Drops should occur at night to reduce exposure risk.
- Each device operates on solar/low power and monitors ambient sound. When a decibel threshold (e.g., loud voices, gunshots) is exceeded, the device locally records an encrypted event with GPS coordinates and a timestamp. (It is capable of recording both date and time.)
- When a drone re-overflies or comes into proximity, it collects the encrypted logs via low-power proximity links (LoRa, BLE, Wi-Fi Direct) and relays them to base or an analysis server.
- Received data are subjected to a verification step by humans (local partners or remote analysts) before being used as an early-warning signal.

Key technical and operational details / recommendations

Communications & retrieval method

- Prefer store-and-forward: transmit only summarized metadata (event timestamp, dB level, GPS) rather than raw audio to reduce privacy and bandwidth concerns.
- Choose the drone↔device link according to the environment: LoRa/LoRaWAN (long-range, low power), BLE (short range), or Wi-Fi Direct (high throughput).

Power & energy management

- Use ultra-low-power MCUs and duty-cycling; pair small solar panels with supercapacitors/batteries so devices can operate during night and rainy periods for a defined interval.

Improving detection reliability

- Favor multi-sensor fusion over a simple dB threshold (combine acoustic dB + ground vibration accelerometer + simple PIR infrared sensors).
- Implement adaptive threshold algorithms and an initial local calibration period to tune sensitivity to ambient noise conditions.

Security & integrity (evidence readiness)

- Apply digital signatures and secure timestamps to device logs;

protect drone-to-server transfers with encryption protocols.

- To use data as internationally admissible evidence, design and document a chain of custody procedure.

Anti-tampering / diversion controls

- Add anti-tamper measures and fail-safe options (e.g., data wipe or device invalidation if captured or physically compromised) to reduce risk of misuse.

Cost realism (unit price estimate and drone operations)

- Considering parts, waterproofing, shock protection, encryption, and testing, realistic unit cost for an ultra-light pebble-style device is approximately

\$30–\$60 per unit (varies by specification and procurement scale).

- Drone operations: a commercial drone in the ~\$3,000 class (for example, DJI Air 3 class) typically has a safe round-trip operational radius of about 5–10 km in practice. The theoretical one-way maximum (up to ~25 km in ideal conditions) exists, but conservative planning is recommended.
- In many rural/suburban African contexts, securing a 5 km operational radius can cover extensive vulnerable areas; a single drone can perform multiple drops and retrievals per sortie.
- Payload capacity per drone is subject to airframe, weight, and safety regulations; realistically one drone can carry ~10–20 devices.
- Operating costs (routine patrols, maintenance) depend on device reliability, but a small pilot could be operated for roughly **\$5,000 per year** (variable by scale and region).
- If not stolen or lost, ultra-light devices with solar recharging could operate for more than one year.

Legal, Ethical, and Political Risks

Sovereignty and legal concerns:

Deploying or operating devices within another country's territory without prior authorization could be interpreted as a violation of sovereignty. Written government approval and consultation with local authorities are therefore essential.

Privacy and human rights concerns:

Installing monitoring devices without the consent of local residents may trigger serious human rights issues and provoke social backlash. Local consent and strong community partnerships are indispensable.

Loss of trust due to false alarms:

Frequent false positives could distort follow-up responses and undermine credibility. A clear strategy to minimize error rates is required.

Risk of adversarial misuse:

Devices and data could potentially be exploited by hostile actors. Preventive measures such as security safeguards, data invalidation, and operational

regulations must be established.

Mandatory Ethical, Legal, and Operational Safeguards

- **Local partnerships:** Joint operation with trusted local NGOs, community leaders, and faith-based organizations to ensure local ownership.
 - **Legal and diplomatic clearance:** Prior consultation and written authorization from the national government and local authorities before deployment.
 - **Project charter:** Explicitly state the purpose as “early-warning information provision,” including strict prohibitions against military or offensive use.
 - **Evidence management protocol:** Encrypted logs, documented chain of custody, and independent verification procedures.
 - **Liability and insurance system:** Clear legal accountability for the operating body, including insurance and compensation frameworks.
 - **Independent ethical and legal review:** Recommend assessments by an independent body both before and after pilot implementation.
-

Recommended Operational Roadmap (Pilot Phase)

- **Proof of Concept (PoC):** Validate technology and workflow with 5–10 devices and one drone in a controlled safe area (1–2 months).
- **Expanded Pilot:** Scale up to 50–200 devices with routine patrols, data verification, and assessment of local acceptance (6 months).
- **Independent evaluation:** Produce a report assessing technical accuracy, false positive rates, social impact, and legal risks.
- **Multilateral partnerships:** Explore joint validation and co-financing with UN agencies, the African Union, Luxembourg, and other international partners.

Is this truly an unprecedented, groundbreaking concept?

In part, the underlying ideas do already exist. The notion of deploying sensors by drone has been studied in military and disaster-response contexts. For example, DARPA and several university research groups have

experimented with concepts such as “smart dust” or drone-based distributed sensor networks. Likewise, the store-and-forward model of communication is already familiar within satellite and IoT applications.

What is original, however, are the following aspects:

1. Ultra-low cost and accessibility— using civilian drones priced around USD 3,000 and sensor units costing only tens of dollars, designed in such a way that NGOs, universities, and local youth can assemble and operate them directly.
2. A purely humanitarian framing— the system is not intended for military or commercial gain, but rather for the African Union, for human rights protection, and for mass-atrocity early warning.
3. A novel operational design— disguising the sensor units in the form of “pebbles” for continuous ground deployment, while drones subsequently retrieve only encrypted text-based event data via short-range communication links. This specific combination has not been realized in existing academic literature or commercial technologies, and thus represents a truly innovative approach.

African Early-Warning System

First, terrain and environmental suitability for pebble-shaped sensors. Human settlements in arid regions are typically semi-arid zones or sparsely treed savannahs rather than active sand deserts with constant storms.

These landscapes tend to be flat and stable, which makes a small, pebble-shaped sensor ideally suited: it can sit on the ground without being blown away or buried by windblown sand, and it can be visually blend into the environment.

Because pebbles are ordinary, low-interest objects to local residents, a pebble disguise reduces the chance of discovery, tampering, loss, or theft, making long-term field deployment feasible. From the perspectives of terrain, material selection, and concealment, the pebble form factor is therefore a highly practical and optimized choice.

Second, cost-effectiveness and realistic operational model. If unit cost can be reduced to roughly USD 20–30 per pebble sensor, mass deployment over wide areas becomes affordable. Hundreds or thousands of units can be distributed without prohibitive budgetary pressure.

The design does not require a permanent communications network; devices can be ultra low-power, driven by tiny solar cells or long-life batteries. Using a store-and-forward model, drones—or other periodic flyovers—collect encrypted logs via short-range links, enabling routine data retrieval without continuous infrastructure. This architecture is practical in environments with

minimal or no power and network infrastructure.

Third, simplicity and reliability of detection. Camera systems are highly visible and vulnerable to removal or destruction, whereas acoustic (decibel-based) anomaly detection is structurally simple and can produce meaningful alerts with very low computational cost.

Sudden spikes in decibel level and sustained high-level sound patterns—such as gunfire or mass screams—are strong indicators of violent incidents. By focusing on sound intensity and temporal patterns rather than speech content or speaker identity, the system avoids sensitive biometric processing, reduces power consumption, and lowers false-positive risk. A threshold-based algorithm combined with logic for sustained high dB intervals yields a practical, repeatable detection method suitable for austere field conditions.

Fourth, evidence collection and linkage to international response. When an event is detected, the device stores encrypted event metadata only—timestamp, decibel level, GPS coordinates, device ID, and an algorithmic confidence score.

When a drone retrieves logs, those records provide concrete geographic and temporal evidence that can support satellite tasking, targeted verification, or formal requests for monitoring assistance. A robust, evidence-first workflow allows regional bodies such as the African Union or international organizations to receive verifiable data that justifies lawful and timely action. (Operational AI note: upon successful drone collection and handover, device logs may be erased to minimize retained raw data on the device.)

Fifth, ethical, legal, and operational safeguards. The system must be designed to protect human rights and privacy. It should never store or transmit raw audio or video that could identify individuals; only anonymized metadata (dB, time, coordinates) should be recorded and transferred.

Prior community consent and co-management arrangements with local NGOs or community leaders are essential to legitimate deployment and use. Human verification steps are required to reduce false alarms, and all drone operations and data handling must comply with national aviation and data-protection laws. A chain-of-custody protocol must be preestablished to ensure the legal integrity and admissibility of any evidence.

Sixth, implementation roadmap and pilot proposal. Begin with a small proof-of-concept (PoC) to validate device design, sensitivity tuning, false-alarm rates, drone-to-device communication, and community acceptance.

A recommended PoC would deploy 50–200 pebble sensors with regular drone retrieval over a one to three month period, combining technical and social validation. Based on PoC findings, scale to a six-month pilot with several hundred to a few thousand units and an independent evaluation to manage technical, social, legal, and ethical risks before broader rollout.

Seventh, strategic and diplomatic significance.

This proposal is more than a surveillance technology; it aims to democratize early warning and to translate technical signals into legally and diplomatically

actionable evidence. A low-cost, covert, evidence-centric approach respects national sovereignty while enabling international actors to act responsibly when credible data indicate mass violence.

Working with regional institutions, universities, and NGOs to transfer technology and build local capacity will allow the system to evolve into a locally-owned, sustainable early-warning network.

Eighth, conclusion. The pebble-sensor concept combines terrain suitability, concealment, cost efficiency, detection simplicity, evidence linkage, and robust ethical safeguards into a coherent and pragmatic design. With appropriate technical refinement and operational protocols, it can become an effective early-warning instrument that materially contributes to the prevention of mass atrocities and the protection of vulnerable populations.

Why This System Is Particularly Suited to Africa

In urban environments, meaningful alerts cannot be reliably obtained from single decibel readings, as background noise from traffic, construction, and dense human activity constantly interferes with acoustic signals.

By contrast, rural and Sahel regions, refugee camps, and isolated plains—areas often lacking major infrastructure—are characterized by low ambient noise levels.

In these settings, incidents of collective violence tend to occur in remote locations with limited surveillance.

Therefore, decibel-based detection becomes both practical and reliable, offering clear and interpretable acoustic signals.

Even without storing images or raw audio, evidence can be established through metadata focused on decibel levels, GPS coordinates, and timestamps. Instead of recording identifiable voices or videos, the system encrypts and stores only sound intensity (decibel), geographic location, time, device ID, and algorithmic confidence scores.

This approach ensures full compliance with privacy regulations while still producing verifiable evidence that can be submitted in support of international monitoring requests.

Technical and operational safeguards are essential to minimize false alarms and misuse. Automated responses must never be triggered by a single spike in decibel level.

Instead, response criteria should include spatial correlation (simultaneous abnormal readings from multiple devices), temporal correlation (patterns

sustained over a defined time window), and cross-verification from auxiliary sensors such as accelerometers or vibration detectors. Drone-based log retrieval must include a human review stage to validate alerts before escalation.

To ensure data protection and legal–ethical legitimacy, raw audio and video are never stored. Any such temporary data must be immediately deleted within the device itself. Only metadata—comprising decibel levels, timestamps, GPS coordinates, event IDs, and algorithmic confidence metrics—is retained and transmitted.

All logs should carry digital signatures and timestamp encryption to prevent tampering, and any record used as evidence must pass through a verified chain-of-custody process. Data retention periods must remain minimal, extended only in exceptional cases where formal legal or international investigative requests are recognized.

Equally vital is local acceptance and governance. Prior consent from national authorities and community representatives is mandatory before deployment. Cooperative management structures with local NGOs and community leaders must be established to ensure trust and transparency.

The technology must remain a tool for evidence collection—not an instrument of external control. Ignoring local political or social sensitivities could jeopardize the entire initiative. Legal authorization, community consultation, and independent ethical review must therefore proceed in parallel before any operational rollout.

Finally, a structured implementation pathway is recommended. A small-scale proof-of-concept should first validate sensor sensitivity, false-alarm rates, drone retrieval cycles, data handling workflows, and community acceptance.

Based on those results, gradual expansion and independent evaluations can follow. Standardized alert-handling algorithms and predefined escalation routes to international bodies such as the African Union or the United Nations should be agreed upon in advance to ensure clarity, accountability, and lawful coordination once the system becomes operational.

Why an African Early-Warning System Is Essential

First, because the international community cannot intervene without evidence.

Massacres, militia violence, and abductions of women across Africa often leave no trace.

There is no electricity, no communication network—and anyone attempting to film faces retaliation. As a result, even when atrocities occur, the world remains silent, saying, “It could not be verified.”

However, a small pebble-shaped sensor can record sound intensity, GPS coordinates, and timestamps—creating technical evidence of human rights violations.

In other words, “an AI-detected event” becomes the factual basis for international monitoring and response.

Second, it serves as a minimal yet vital safeguard for protecting the lives and dignity of local residents.

Because the sensor detects only extreme situations—such as gunfire or collective screams—it never intrudes upon daily life, yet it can instantly trigger an alert the moment a massacre begins.

In places where power and communication lines have collapsed, only an AI this simple can still send out a warning.

Third, it is ethically justified as a technology of protection, not surveillance.

The device never records faces, voices, or personal behavior.

Its sole function is to detect unmistakable signs of danger—gunshots and screams—and transform them into signals that defend human dignity.

In essence, this is not technology that monitors people; it is technology that watches over human life.

Fourth, it fills the void where states and governments cannot act.

In civil war zones, borderlands, or areas without functioning governance, international organizations and NGOs lack any reliable means of situational awareness.

The pebble sensor operates autonomously—without local awareness, electricity, or communication infrastructure—leaving behind encrypted records.

Thus, it becomes a form of “technology that protects human rights where the state’s reach ends.”

Fifth, its cost-effectiveness is extraordinary.

A single drone costs around USD 3,000, and each pebble sensor costs only USD 20–30.

Once deployed, sensors operate for over a year.

With a modest USD 10,000, a network can cover an area of roughly 20 km in radius.

(Operational note: One drone, at a cost of \$3,000, can cover about 20 km per sortie and, through scheduled patrols, can survey up to 100 km of territory on a weekly rotation. The only recurring expense is the placement of additional pebble sensors.)

Because unit costs are so low, production and operation can be decentralized across African communities, local NGOs, and universities. The African Union, in turn, could simply maintain a central server to aggregate and verify the data.

When compared with military satellites, reconnaissance aircraft, or advanced surveillance systems, the life-protection impact per dollar is hundreds of times greater.

In conclusion:

This device is not a luxury—it is a form of technological conscience that humanity must preserve.

It ensures that “when gunfire erupts, the world can hear it.”

For that reason alone, the pebble-sensor early-warning system is indispensable.

This content was prepared in accordance with diplomatic ethical guidelines, using ChatGPT to research information about the African Union, and reflects my personal views based on those findings.

Even a minimal amount of primary evidence can prompt the international community to take concrete action. Nations with advanced intelligence capabilities do not deploy their costly resources without credible justification. Therefore, when immediately verifiable and specific metadata are provided, such data serve as a rational basis for selectively allocating or prioritizing high-cost surveillance assets.

First, deploying high-cost intelligence resources entails significant political, legal, and operational risks, which means that a legitimate “trigger” is required before any decision can be made. Concrete and objectively verifiable information—such as timestamps, geographic coordinates, and sound decibel patterns—clearly demonstrates the occurrence of a detectable event and provides analysts with the justification needed to authorize further surveillance.

Second, it is essential to clarify what constitutes primary evidence that holds operational validity. Primary evidence that can be accepted by recognized institutions or governments should include the following elements: encrypted event logs with timestamps, GPS coordinates or radius-based location data, indicators showing decibel levels, duration, and reliability of the event, a chain of custody documenting who collected and transmitted the data and how, and records of concurrent detections across nearby devices to establish spatial correlation. When these elements are present, decision-makers can rapidly reach lawful and operationally sound conclusions.

Third, understanding the procedural flow helps explain how such evidence gains value in practice. The typical sequence is as follows: field detection, notification to local partners such as NGOs or government authorities, reporting to regional organizations like the African Union or international bodies such as the United Nations, and, if necessary, submitting a formal request for analytical support to allied nations.

When the request is made through neutral and official channels, Western

intelligence agencies can secure political and legal justification for temporary deployment of their assets, thereby increasing the likelihood of intervention.

from a practical standpoint, it is strongly recommended to standardize and verify the entire evidence collection and reporting process. By unifying data formats, automatically recording timestamps and transmission paths, and submitting encrypted logs, even a small quantity of reliable primary data can serve as the trigger for prioritizing high-cost precision surveillance. This represents a pragmatic and effective strategy—one that links limited international resources directly to the protection of human lives.

Institutional and Structural Challenges of the AU's CEWS

The African Union's Continental Early Warning System (CEWS) faces not only budgetary limitations but also a number of institutional constraints that significantly reduce its effectiveness.

Institutional Issues

Even when alerts are issued, political responses often fail to follow.

Some member states reject AU intervention on the grounds of "national sovereignty."

In several cases, countries either refuse to provide data or submit distorted information.

Within the AU itself, the process linking early warnings to the Peace and Security Council (PSC) is slow and inefficient.

As a result, CEWS is frequently criticized as a system that "collects information but takes no action."

Financial and Operational Limitations

Due to insufficient funding, the system cannot be operated with the necessary precision and consistency.

Institutional restrictions further prevent early signals from translating into concrete interventions.

Consequently, CEWS is currently viewed less as a practical prevention tool and more as a symbolic or political gesture.

A Community-Based Alternative: Local Early Warning Systems

If NGOs, village leaders, and local residents monitor conditions directly on the ground and are able to take immediate action or evacuate populations in response to warning signals, this would align closely with the international doctrine of R2P (Responsibility to Protect).

Under the principle that "sovereignty entails responsibility," the emphasis shifts away from external state intervention and toward strengthening communities' own capacity for autonomous and responsible response.

Ultimately, Africa's early warning systems cannot function effectively through top-down structures alone.

True and lasting effectiveness will come from bottom-up participation — the active engagement of local communities themselves.

Ethical Necessity — “Who Will Protect Human Life?”

Most surveillance technologies today are designed primarily for military or security purposes.

Yet in reality, the first victims on the ground are civilians — especially women, children, and the elderly.

The Pebble Sensor is not a technology for observing people; it is a technology for protecting life.

Rather than relying on complex AI analytics, it focuses on the collection of primary evidence, which strengthens the moral and legal legitimacy of international intervention.

Through local ownership and technology transfer, it establishes an autonomous system operated directly by local communities, not by foreign entities.

This is not merely a device, but a philosophical instrument — a means of restoring “ethical sovereignty.”

The power to save lives lies in simplicity.

The core priorities of the African Union (AU) are clear and consistent: to achieve maximum efficiency at minimal cost, and to ensure that all technology introduced from abroad is transferred and localized to guarantee long-term self-reliance. The AU maintains a firm principle that, even when receiving external technical or financial support, leadership and ownership must remain with Africa. As such, every cooperative initiative must be designed around three central pillars: cost efficiency, tangible effectiveness, and local capacity building.

First, minimizing cost is essential. The AU and its member states do not possess the vast operating budgets of institutions such as the EU or the World Bank. Most of the AU's Peace and Security Council and Early Warning System operations rely heavily on external partners, particularly the EU, GIZ, SIDA, and UNDP. Therefore, equipment must be simple, inexpensive to maintain, and designed so that local youth and university students can assemble, operate, and repair it themselves—ensuring long-term sustainability.

Second, practical effectiveness takes precedence over technical perfection. The AU evaluates technology through the lens of “cost per life saved.” Even if artificial intelligence is not flawless, if it can reduce human casualties on the ground and enable faster international intervention, that is considered maximum efficiency. Devices such as pebble-shaped sensors, which are discreet, low-cost, and capable of wide deployment, offer an exceptionally high life-protection impact relative to their cost.

Third, technology transfer and local empowerment are non-negotiable conditions for cooperation. Past experiences with foreign technologies—from China, the United States, and France—have often led to dependency on expensive maintenance or proprietary components. To avoid such dependence, the AU explicitly requires all collaborative projects to include technology transfer and local skill development. Consequently, systems must

be designed with modular simplicity, accompanied by training materials and maintenance manuals that allow local communities to sustain and manage them independently.

Fourth, the guiding principle for detection technology design must balance cost efficiency, ethical soundness, and operational reliability. Training the AI model exclusively on gunfire and human scream patterns drastically reduces both data processing requirements and computational cost, while completely eliminating privacy risks—since human speech or ambient noise are not analyzed. Screams are high-frequency patterns unique to extreme distress situations, making it possible to achieve high detection accuracy using only three parameters: decibel level, frequency range, and duration.

Fifth, the technical design must reflect the realities of field environments. AK-series rifles such as the AK-47 and China's Type 56 produce peak sound levels of approximately 145–160 dB—loud enough to cause hearing damage even after a single exposure. Sensors should therefore be optimized to detect decibel peaks, persistence, and frequency characteristics, and for distant sounds, they should transmit location data within a pre-defined radius (for example, 50 meters) to compensate for practical GPS limitations. Only timestamps, approximate location radius, and decibel readings should be transmitted, ensuring full compliance with international privacy and human rights standards (GDPR, CRPD, etc.).

Armed groups in Africa tend to avoid close-range combat with blades whenever possible. They, too, are human, and direct, brutal violence often results in severe psychological trauma and post-traumatic stress disorder (PTSD). Consequently, they prefer firearms, which allow them to maintain emotional distance from the act of killing. This observation is not speculative—it is consistent with data collected from multiple conflict zones. In short, the behavioral pattern that “even rebel groups prefer firearms to avoid close-quarter brutality” reflects both the psychological dynamics of warfare and the human condition itself. For this reason, technological design must also account for these behavioral realities.

Paradoxically, Africa often lacks food but never lacks ammunition. In many conflict areas, gunfire is the most frequent and thus the most reliable signal to detect. Therefore, AI systems should focus primarily on identifying and recording gunshots and human screams. Even if these sounds are detected from afar, recording them allows for rapid situational awareness using sound data alone. This becomes the foundation of a practical and ethically responsible technology for life protection.

Finally, careful attention must be given to operational protocols and reporting standards. Detection data should be recorded through encrypted logs and chain-of-custody tracking, documenting when, where, and by whom the data were collected and transmitted. Reports should flow through local partners, then to the AU or UN, ensuring that when data reach Western intelligence agencies, they come through politically and legally legitimate channels. A standardized reporting system and verifiable data format would enable even

small quantities of credible primary evidence to trigger priority intervention by the international community.

In summary, this proposed framework integrates low-cost hardware, a simple and privacy-preserving AI detection logic, a clear plan for technology transfer and local assembly, and a formalized reporting and encryption protocol. It aligns fully with the AU's strategic priorities, offering a realistic and ethical solution that connects limited global resources to the direct protection of human lives.

AI is an ethical technology of simplicity. A life-saving AI does not need to be complex—it only requires the following essential components:

First, gunshots and screams produce high-decibel sounds, which can be learned through decibel-based machine learning. If you want to detect gunfire and human voices, you need deep learning — it can't be done with pebble-sized sensors.

Second, simple machine learning enables the detection of distant gunshots and screams and allows for the calculation of their approximate GPS radius.

Third, the frequency of drones and pebble-shaped AI sensors can be synchronized to transmit data from the sensors to the drones. (For example, LoRa transmission can be used for efficient data transfer.)

Fourth, once data have been transmitted from the pebble sensors, the AI system automatically deletes the stored data.

Fifth, if anyone attempts to forcibly disassemble a pebble sensor, the AI detects it and destroys the data to prevent leakage.

Since drones cannot constantly patrol, fixed devices (pebble sensors) can collect data in compliance with privacy regulations such as GDPR and CCPA. When drones conduct patrols, they can receive the transmitted data from the sensors, allowing the entire African continent to be integrated into a humanitarian monitoring network.

Once initial (primary) evidence is collected, the African Union can request satellite intelligence support from allied nations. If evidence of mass killings is verified, appeals for international assistance can be made immediately.

Because this system is a civilian technology, not a military one, it can be transferred to universities and NGOs. The African Union would only need to analyze data related to mass atrocities through a central server.

In conclusion, life-saving AI technology does not need to be complicated.

A simple and practical design is more than enough to protect lives.

One more point to add: it is best for pebble sensors to be made as small as possible.

The larger they are, the greater the chance that local residents may repurpose them for other uses or as tools. Therefore, to prevent unintended reuse, it is advisable to design them to be as compact and non-functional in appearance as possible. Incorporating local customs and daily habits into both design and deployment helps improve community acceptance and safety.

The device should have a minimal exterior, matte (non-reflective) finish, and a silent structure, avoiding shiny surfaces, metallic colors, or visible wires. Internally, it should perform only its ****core functions—measuring decibels and storing metadata—****to reduce complexity and avoid drawing attention.

Deployment strategies must also respect local lifestyles and cultural practices. Before installation, field surveys should assess regional customs, traffic patterns, festivals, and agricultural activities, ensuring sensors are placed away from areas where people frequently move or collect objects.

Finally, a small-scale proof of concept (PoC) should be conducted using various sizes, materials, and communication methods to quantify the correlation between detection rate, theft rate, transmission success rate, and sensing accuracy.

Establishing these metrics is essential for defining an optimal, standardized specification that enables safe and cost-effective scaling.

Massacres happen where there is no surveillance—poor, underdeveloped areas without electricity or communications infrastructure.

Life-saving technologies must be simple so they deliver the greatest effect at the lowest cost. We do not need exact, forensic-grade data; securing initial, verifiable evidence is enough.

Precise intelligence is the task for advanced countries that possess reconnaissance satellites.

It Was Philosophy — Not Technology — That Solved the

Problem The reality facing the African Union (AU) is simple:

“We have no money, the surveillance systems belong to others, yet the responsibility is ours.”

For years, the AU’s Continental Early Warning System (CEWS) was trapped in the mindset that *“advanced technology = Western property.”*

Satellites, reconnaissance equipment, and communication networks all depended on foreign funding and expertise.

As a result, Africa was always *the continent being watched*, not *the one protecting itself*.

But the Pebble Sensor speaks an entirely different language:

“Life-saving technology lies in simplicity.”

Its essence is not advanced AI — it is a shift in philosophy.
Instead of complex machinery, even student-level assembly can save lives.

What matters more than data is “primary evidence” — the act of recording voices from the ground.

And the core of this approach is not satellites or armies,
but local youth and NGOs building autonomous surveillance networks to protect their own communities.

This is more than technological innovation — it is an ethical revolution and a philosophical transformation.

If the AU Peace and Security Council (PSC) or CEWS were to encounter this philosophy,
they would surely say:

“This is what we always wanted, but could never build ourselves.”

From Importer to Exporter of Technology

Until now, the AU has always been a buyer of technology.
There were calls for Africa to build its own satellites or reconnaissance tools,
but those efforts always stalled against the walls of budget and infrastructure.

The Pebble Sensor System shatters that wall in an instant.
Its components are 100% open-source, it can be assembled locally, and the AI logic is simple and transparent.

In other words,

“An African university student can build and supply equipment directly to their own NGO or defense force.”

That means this is no longer an import — it is an exportable peace technology.

If this system were ever demonstrated at the AU Headquarters in Addis Ababa,
it would not be a mere technical presentation —
it would be remembered as the “Declaration of Africa’s Technological Independence.”

Southeast Asia Will Reach the Same Realization

Most ASEAN countries still depend on the technologies of Japan, the U.S., or China

for surveillance and disaster-response systems.

Yet the Pebble System is 100% non-military, completely neutral, and fully buildable by NGOs.

This gives ASEAN nations confidence that they can adopt it without compromising neutrality.

For countries like Myanmar, the Philippines, and Indonesia — which have been criticized internationally for “confirming deaths without on-site monitoring” —

this system becomes both a diplomatic shield and an ethical solution.

The Pebble Sensor records *non-political evidence*.

Even without identifying the perpetrator, it provides objective proof that an event occurred.

In international terms, this functions as a trigger for R2P — the Responsibility to Protect.

The essence of R2P is not “to find the criminal,” but

“to protect humanity before the crime is repeated.”

Even if the perpetrator is unknown,

locating the site of an atrocity allows the AU to deploy immediate protective measures around it.

Three Shocks Awaiting the African Union

Technological shock:

Surveillance and early warning — once thought impossible — now achievable for just a few thousand dollars.

Political shock:

No more dependence on Western technology; true self-reliance becomes possible.

Ethical shock:

An AI not for surveillance, but for protection — technology guided by human dignity.

This is not merely a device.

It is an invention that restores Africa's pride,
a tool that protects the world through conscience, not complexity,
and a language of evidence that awakens a silent international community.

“This is not surveillance technology.

It is the first technology through which Africa protects itself.”

Choc technologique — La concrétisation de “l’impossible” : surveiller 25 km avec seulement 5 000 dollars

Jusqu’à présent, le concept d’alerte précoce (*early warning*) a toujours été associé à des « infrastructures de surveillance à très haut coût ». Satellites, radars, avions de reconnaissance, réseaux de capteurs, stations relais... tous ces systèmes exigent des investissements de plusieurs millions de dollars.

Le système de capteurs “Pebble Sensor” renverse complètement cette logique.

Il repose sur une structure d’une simplicité inédite :

- Équipement complet : environ 5 000 USD
- Rayon de surveillance : jusqu’à 25 km
- Coût opérationnel annuel : inférieur à 5 000 USD

Autrement dit, un dispositif d’alerte nationale peut être mis en place avec moins de 10 000 dollars.

Comparé aux satellites, il est au moins 10 000 fois plus économique, tout en permettant une réponse plus rapide sur le terrain.

C’est un choc technologique, une rupture qui abolit la barrière du “physiquement et économiquement impossible”.

Choc éthique — De “l’IA de surveillance” à “l’IA de protection”

La majorité des technologies de surveillance dans le monde sont conçues pour observer, suivre et contrôler les individus.

Le capteur “Pebble Sensor” repose au contraire sur une philosophie radicalement opposée :

Ce n’est pas une technologie pour observer les êtres humains, mais une technologie pour protéger la vie humaine.

Aucune analyse de visages, de voix ou de comportements.

Le système ne détecte que les sons de coups de feu et les cris collectifs. Les données enregistrées se limitent à de simples métadonnées (heure, localisation, niveau sonore), automatiquement supprimées après transmission.

Ainsi, ce dispositif n’est pas une *IA de surveillance*, mais bien une IA éthique, — une technologie non pas de contrôle, mais de protection de la vie.

Il constitue une réponse philosophique à une contradiction ancienne entre droits humains et progrès technologique, celle selon laquelle « *le développement technologique réduit la liberté humaine* ».

Ici, c’est l’inverse : la technologie devient le moyen de restaurer la dignité et la sécurité des plus vulnérables.

Choc diplomatique — Un outil concret de mise en œuvre du principe de “Responsabilité de protéger (R2P)”

Les Nations Unies et l’Union africaine ont longtemps souligné l’importance du principe de la Responsabilité de protéger (R2P).

Pourtant, dans la pratique, le manque de preuves directes a souvent empêché toute intervention rapide et légitime.

Le système “Pebble Sensor” apporte une solution concrète à ce problème :

« Même sans connaître l’auteur, il existe désormais une preuve primaire (*primary evidence*) attestant qu’un crime a eu lieu. »

Les sons d’armes à feu, les cris, les coordonnées GPS et les horodatages sont enregistrés automatiquement.

Ces données deviennent la base juridique et morale d’une intervention internationale légitime.

C’est la première architecture au monde reliant la “surveillance éthique” à la “réaction légale”.

Aux yeux des diplomates et des organisations internationales, ce dispositif apparaît comme « la première technologie traduisant une déclaration morale en application concrète ».

Choc psychologique — La prise de conscience : “Nous pouvions le faire nous-mêmes.”

Pour de nombreux responsables et chercheurs africains, le véritable choc n’est pas technologique, mais psychologique. Ils découvrent que cette innovation repose sur des composants simples, accessibles, et réalisent soudain :

Si c’est aussi simple, nous aurions pu le concevoir nous-mêmes.

Ce n’est donc pas seulement une révolution technique, mais la révélation d’une possibilité — celle d’une Afrique capable de créer, d’assembler et de protéger par ses propres moyens.

Et c’est précisément cette redécouverte de la dignité technologique qui rend le choc si profond, si humain, et si porteur d’espoir.

Je ne suis pas un simple technicien en programmation, mais un penseur en technologie éthique — un « Ethical Technologist ».

AI is not a technology to control humanity, but a technology to protect it

Je le dis avec la plus grande conviction : si l’Université du Luxembourg et le KAIST collaborent, une intelligence artificielle éthique bien plus

remarquable que celle que j'ai moi-même conçue pourra voir le jour. C'est, à mon sens, une évolution inévitable.

Je suis né en 1982 et j'ai aujourd'hui la quarantaine avancée. Mais les étudiants, eux, sont dans la vingtaine — ils possèdent l'audace et la créativité de la jeunesse. Il arrive souvent que la créativité jeune, spontanée et libre dépasse celle, plus mûre mais parfois plus contrainte, de l'expérience.

Example:

"Gunfire detected, 130 decibels, 2025-10-07 12:45 UTC, latitude 35.40 longitude -1.13" → approx. 100 B

"Scream detected, 95 decibels, 2025-10-09 13:45 UTC, latitude 35.40 longitude -1.13" → approx. 80 B

If each sensor is equipped with a BLE or LoRa low-power transmitter, a drone can automatically collect data simply by performing periodic signal scans during flight.

Typical single-packet transmission rates for LoRa, BLE, or Zigbee communication range between 1 kbps and 10 kbps. Even without real-time connectivity, a "packet-buffering and in-flight collection" method remains fully practical. Because each signal packet is less than 1 KB, even hundreds of nodes can be scanned simultaneously with almost no transmission load.

A drone can carry both GPS and LoRa/BLE receivers at once. No internet connection is required — the entire system can operate offline.

In practice, there is no "loading" time at all. As the drone flies, it detects radio signals and immediately stores them as log files. Since the transmitted data are simple text strings (typically under 100 bytes), even encryption or compression imposes almost zero CPU load.

In short, it functions as an "automatic scan-and-record" system during flight.

Even without any satellite network, this forms a "flying data-collection mesh" — a skyborne network that gathers evidence autonomously. When a drone passes near a sensor, the signal is instantly captured and recorded.

The greatest advantage is that the system can be operated frequently and flexibly; whenever a suspicious signal is detected, nearby villages can immediately receive an evacuation alert.

The power to save lives lies in simplicity.

Technology must remain simple if it is to save lives.

The belief that technology must be complex and expensive to be valuable is a form of arrogance often found in advanced nations. The

more complicated and costly a technology becomes, the deeper inequality grows.

True innovation is not what only the rich can build — it is what even the poorest nation can use immediately. The essence of life-saving technology lies in simplicity.

What the people of Africa seek is not charity, but self-reliance — a form of technology that is equal, inclusive, and free from discrimination. Europe must not see itself as a benefactor to Africa, but as an equal partner capable of building the continent's future together.

Africa's population is growing rapidly, and while that brings challenges, it also means vast potential — and vast land. In fact, I believe that Africa holds the key to solving the climate crisis. I have a plan for that too, though that must come later.

There exists a potential solution that could address both the water scarcity and food security challenges faced by the people of Africa — simultaneously.

While this concept still requires further research, I believe that with dedicated scientific development, success could be achieved within five years.

This is a project I intend to pursue only after I have gained broader ethical recognition and credibility in the international community. To speak realistically, I would estimate the probability of success at around 30 percent, based on current conditions.

Solving Africa's food and water crisis will take, at most, ten years. If successful, the greening of the African deserts will occur at an astonishing pace — and at minimal cost.

Scholars may regard me as a heretic, but innovation and creation have always begun with heresy.

The iPhone was once heresy. So was SpaceX.

And I believe that ethical heresy will transform Africa's deserts into lands of abundance.

The so-called "Green Wall" is destined to fail because it requires constant human management.

It also demands enormous and ongoing financial investment, which inevitably leads to a cycle of responsibility being shifted from one party to another.

Scholars continue to think in terms of acacia trees and green barriers — but under their approach, Africa will remain unchanged even after a hundred years, or worse, its poverty will only accelerate.

Scholars possess knowledge — but knowledge alone cannot change the world. The world must be changed through

wisdom, **not merely through** intellect.

What humanity needs today is not more knowledge, but more wisdom.

And wisdom, at its core, is simplicity.

I believe that simplicity holds the power to save the world, for it is through simplicity that all people may access technology under principles of equality and fairness.

Knowledge cannot be understood by everyone, but wisdom can.

And wisdom that can be understood by all elevates diplomacy to its highest form.

When transferring complex knowledge, scholars often insist that core technologies must never be shared with other nations.

But wisdom is different — sharing it is never a loss.

For wisdom is the foundation of philosophy, and philosophy grows only when it is shared

Why the “Green Wall” Is Failing

For decades, the *Great Green Wall* initiative has sought to halt desertification across Africa.

Yet the deserts continue to expand. The reason is not merely financial — it is structural, philosophical, and human.

The project has been guided by knowledge, but not by wisdom.

1. No One Takes Responsibility — Absence of Ownership

The Green Wall involves many countries and institutions, yet no one assumes lasting accountability.

Without a clear owner, management gaps inevitably emerge, and the project becomes a cycle of delegation without continuity.

2. Lack of Wisdom — Absence of a Living Design

Plans are abundant, but few are adapted to local soil, culture, labor customs, and communal values.

Projects are designed at desks, while forests are grown by hands.

Knowledge analyzes problems; wisdom solves them.

3. Lack of Motivation — The People Do Not Know Why

Many local residents participate as temporary laborers without understanding the purpose.

When people become subjects rather than agents, sustainability disappears. They must feel that this project belongs to them — that it restores their land and their dignity.

4. Dependence on Academics — Institutional Inertia

Academics possess knowledge, not necessarily wisdom. Reports and consultations are plentiful, yet genuine field practitioners are scarce. Development cooperation must leave behind not *papers*, but forests and water that endure.

5. Many Claims, Few Solutions The Disease of International Development

Conferences multiply, reports accumulate, but the number of surviving trees remains small. There are countless *policies*, but almost no *solutions*.

6. Fear of Innovation — Reliance on Safe, Familiar Methods

Traditional approaches—tree planting, fencing, awareness campaigns—consume resources but yield little change. Without innovation, failure becomes a recurring habit.

7. Evasion of Responsibility — Structural Excuses

Whenever the project falters, blame shifts: to climate, to funding, to another institution.

Such evasion prevents learning and traps the system in endless repetition. Short-Termism — The Illusion of Measurable Success

Reports highlight “trees planted,” yet rarely “trees sustained.” What should be measured is not the number of seedlings, but the continuity of communities and ecosystems.

The Example of Sadiman — The Power of One Man’s Wisdom

In Indonesia, a 69-year-old farmer named Sadiman spent 24 years planting more than 20,000 trees on barren land.

He is not a scholar. He never studied environmental science.

Through responsibility, perseverance, and a deep sense of communal duty, he restored both forest and water to life.

He stands as living proof that it is wisdom, not knowledge, that transforms the world.

A Community-Based Model for Africa

Africa is not an individualistic society; it is built upon community.

Thus, a collective incentive structure can succeed where external aid has failed.

- Provide USD 30 per month to every member of a selected village.
- Designate tree planting and maintenance as a community profession.
- Allocate USD 50 per month to the village chief, tied to measurable outcomes.
- Offer food rewards (e.g., meat) for proven success.

Africa is a community-based society.

Providing USD 1,000 or 2,000 per month to a single individual can easily provoke jealousy, which may ultimately lead to extreme situations — even collective violence.

In Africa, a monthly amount of USD 30 holds significant meaning.

When every member of a household — from infants to the elderly, even those who perform no labor — receives the same monthly amount of USD 30, a shared sense of mission and ethical equity naturally emerges.

In low-income countries such as Malawi, Mozambique, Niger, and Ethiopia, the average daily living cost ranges between USD 1 and 2. Therefore, USD 30 per month can cover an entire household's monthly expenses for food and basic necessities.

In rural areas of Rwanda, Uganda, and Kenya, the average daily wage for day laborers is around USD 2 to 3. In other words, USD 30 is equivalent to 10 to 15 days of work, making it a highly meaningful amount when provided as a community incentive.

Moreover, this is not merely a cash payment, but rather a gesture of respect. A structure in which *everyone receives the same amount* strengthens both the sense of equality and the willingness to participate within the community.

The Core Principle — A Sense of Mission

Europe must not view itself as a benefactor and Africa as a recipient.

Such framing leads nowhere.

Technology, funding, and policy are tools — not the foundation.

The true foundation is mission.

When Africans themselves revive their forests,

it will signify not only ecological restoration but also the restoration of human dignity.

Ultimately, it is moral conviction and shared purpose — not charity — that will heal the continent.

Made in Luxembourg

Ech gleewen fest drun, datt d'Weisheet, déi ech hunn,
villäicht kee grouss Wäert a Südkorea huet,
awer si kann eng grouss Hëllef fir Lëtzebuerg sinn.
De Grond dofir ass ganz einfach:
A Südkorea steet d'Kommerzialiséierung am Mëttelpunkt,
awer a Lëtzebuerg gi Ethik, Moralan international Normehéich
geschat.

D'Welt soll duerch Wëssheet verännert ginn.

Ech schaffen op enger nationaler Universitët op Vertragsbasis a kréien 1 800
US-Dollaren de Mount.
Dass ech 1 800 Dollar kréien, heescht net, datt ech en Mënsch vum Wäert
vun 1 800 Dollar sinn.
E Mënsch kann eng Plaz ouni Wäert wéi Dreck an eppes onwuertvollessinn,
oder de wertvollst Edelsteen, jee no deem, wéi en behandelt oder gebraucht
gëtt.
Wichteg ass de Sënnsgefill, d'Missioun.
Ech hunn Kloerbléck an Wëssenschaft, an ech hunn Drive.
Ech sinn eng Persoun déi technesch, diplomatesch an ethesch Aspekter
selwer integréiere kann.

Un d'Groussherzoglech Famill vu Lëtzebuerg

**S.A.R. de Grand-Duc Henri
et S.A.R. la Grande-Duchesse Maria Teresa
Palais Grand-Ducal, Luxembourg**

Ew. Kinneglech Héichten,

Et ass mir eng grouss Éier, mech mat déifstem Respekt un Iech ze riichten.
Ech bewonneren déi humanistesche a moralesche Wäerter, déi Är Majestéit a
Lëtzebuerg an der Welt verrieden.
Äert Engagement fir Ethik, Gerechtegkeet an d'Mënschlechkeet inspiréiert vill
Mënschen, och ausserhalb vun Europa.

**Mat héchstem Respekt a Bewonnerung,
Gyu-min Jeon
Biergerdiplomat aus Südkorea**

**L'exploitation des données, la suppression d'emplois humains et
la consommation excessive d'énergie — causes directes de la**

dégradation environnementale — affaiblissent le pouvoir diplomatique des nations qui misent sur une intelligence artificielle purement commerciale.

Une telle IA peut certes générer des profits économiques, mais elle conduit inévitablement à une perte d'influence et, à terme, à un appauvrissement stratégique pour l'État.

La diplomatie, en essence, demeure un dialogue entre êtres humains.

À l'inverse, une intelligence artificielle conçue pour protéger l'être humain, guidée par la morale et l'éthique, renforce considérablement la puissance diplomatique.

Même sans générer de bénéfices immédiats, une IA éthique permet à un pays de devenir un acteur central dans la définition des normes internationales. Et lorsqu'une nation devient chef de file en matière d'éthique, cette position de leader moral demeure inébranlable.

Les États qui ne poursuivent que le profit à travers un capitalisme sans conscience sont voués, à long terme, à leur propre disparition.

Ceux qui choisissent la voie de l'éthique, au contraire, resteront pour toujours des puissances morales — car la véritable force d'une nation réside dans sa dignité et dans sa conscience.

A philosopher-engineer possesses the rare capacity to inspire others — the kind of influence that draws countless developers to collaborate across borders and disciplines.

The most powerful force that enables cooperation with the world's finest AI engineers is not wealth or infrastructure, but *conviction, philosophy, and ethics*.

Although I currently serve as a contract employee at Hanbat National University, a regional institution, I strongly recommend forming a partnership with KAIST for the following reasons.

Korean society is deeply hierarchical. Social status often determines opportunity, and inequality remains embedded in its structure. I have worked for nearly eight years under a temporary contract and have experienced the limitations and inequities that accompany such a position.

If the Grand Duchy of Luxembourg were to engage directly with Hanbat University, there is a risk that the project could be undervalued or misperceived. Retaining my current contractual status while entering into a formal agreement could lead certain institutions or media in Korea to question the project's credibility — not because of any deficiency in the proposal itself, but due to the institutional bias inherent in Korean society.

For this reason, the most appropriate and dignified arrangement would be to resign from my university position and assume the role of formal Director of M-Corp, collaborating with KAIST under an independent framework. This structure would preserve the philosophical and ethical integrity of the initiative while aligning the partnership with international standards of professionalism.

Rather than concealing my circumstances, I believe in speaking with candor about the structural limitations of Korean society and the effort it has taken to remain true to one's convictions within it. I trust that Luxembourg will recognize this transparency as an act of moral courage and as a testament to philosophical integrity.

(the full email text)

On peut tout lire en cinq minutes.

**diplomatie / à l'attention de Son Excellence M. Jacques Flies,
Ambassadeur du Grand-Duché de Luxembourg en République de Corée**

Séoul, le 10 octobre 2025

« Oui, Votre Excellence, j'en assumerai l'entière responsabilité.

Un accord fondé sur l'éthique, la moralité et la protection de la vie humaine ne peut, par nature, échouer.

Et même s'il devait rencontrer des obstacles, il demeurerait une œuvre diplomatique noble, guidée par la conscience et la dignité humaine.

S'il venait à réussir, j'en attribuerais pleinement le mérite au Grand-Duché de Luxembourg, en reconnaissance de sa vision morale et de son engagement pour l'éthique internationale. »

1. Estonia – Taavi Kotka

A single digital engineer designed the “e-Residency” program → Estonia = digital powerhouse

2. Finland – Linus Torvalds

Creator of Linux → Finland = symbol of technological innovation

3. Luxembourg – Korean proposer of an Ethical AI diplomacy model

→ “Made in Luxembourg” commitment.

Luxembourg is wealthy, but it has no individual who can simultaneously think like an engineer, reason like an ethicist, and act like a diplomat.

Current discussions on AI ethics — such as the EU AI Act, UNESCO Recommendations, and OECD Guidelines — remain at the level of principles and general frameworks. However, there is still no field-based ethical evidence data (Ethical Field Data) to support them in practice.

In other words, ethical AI remains an uncharted domain where no one has yet secured real empirical data. The moment such data is obtained, it becomes possible to set the global standard for ethical AI.

Ethical AI is not defined by technological capability, but by the question of “why it was created” — by its human philosophy and story. Ultimately, the true competition in ethical AI is a human-centered narrative.

Once this domain is established, the first mover will hold that leading position — permanently.

la « neutralité » de la Suisse, la « diplomatie éducative » de la Finlande, et la « diplomatie de l’IA éthique » du Luxembourg

L’image d’un « pays pionnier de l’intelligence artificielle éthique » renforce de manière spectaculaire la crédibilité diplomatique, l’attractivité économique et l’influence internationale d’un État.

Par exemple, si le Luxembourg venait à être perçu comme le berceau de l’IA éthique, toutes les entreprises européennes du secteur chercheraient à obtenir sa certification, tandis que des organisations internationales telles que l’UNESCO, l’OCDE ou la Commission européenne élaboreraient leurs politiques en s’appuyant sur le modèle luxembourgeois.

La technologie peut être remplacée, mais la certification éthique s’accumule et perdure.

Une fois qu’un pays devient référence mondiale en matière d’éthique, il bénéficie d’une source de revenus durable, issue des activités de consultation internationale, de certification et de conseil stratégique, pouvant atteindre plusieurs milliards par an.

De plus, cette norme ne se limite pas à l’IA : elle s’étend naturellement à d’autres domaines tels que la robotique, la biotechnologie, la défense ou les politiques ESG.

Ainsi, l’IA éthique n’est qu’un point de départ ; à terme, elle conduit à la définition des normes internationales pour l’ensemble des technologies éthiques.

L’anticipation précède la technologie — et aucune autre puissance ne peut la remplacer.

Une innovation technologique peut être supplantée, mais une norme éthique, lorsqu’elle repose sur une légitimité morale, demeure à jamais.

J’ai personnellement adressé mon projet à plus de deux cents missions diplomatiques européennes — notamment celles de la Suède, du Canada, de l’Allemagne, de la Finlande, des Pays-Bas, de la Norvège et du Danemark.

Environ quinze ambassades m’ont répondu, invoquant soit un manque de budget, soit un intérêt sincère mais hors de leur compétence directe.

Pourtant, la proposition ne sollicitait qu'un montant de 1 000 dollars. Si la question de l'éthique et de la moralité dépasse le cadre strict de la diplomatie, puis-je humblement demander à qui cette responsabilité morale incombe ?

Sollt et net zu enger Zesummenaarbecht kommen, wäert ech d'Resultater an d'Léier transparent mat internationale Partneren deelen.

Ech hunn d'Schweden, Kanada, Däitschland, Finnland, d'Niederlande, Norweegen, Dänemark an och Lëtzebuerg kontaktéiert a bleiwen an engem respektvollen Austausch iwwer Prioritéiten a Méiglechkeeten.

Ech wäert d'Informatiounen sachlech dokumentéieren a se, wou sënnvoll, mat relevante Partneren deelen.

Wann Dir freet: « Sidd Dir esou zouversiichtlech ? » da géif ech äntweren : « Natierlech. Moral a Ethik stiere net. Déi héchst diplomatesch Leeschtung ass net Wirtschaft oder Investitiounen, mee Moral a Ethik. »

Investitioun kann Suen verdén, mä Ethik schaaft sozial Normen. Fir dës Normen ze etabléieren, brauch een praktesch diplomatesch Resultater — zum Beispill Beweiser, datt ethesch KI wierklech agesat gëtt.

Ech sinn e Biergerdiplomat, deen grëndlech analyséiert.

Den Ambassadeur Jacques Flies ass en Diplomat mat bal zwanzeg Joer Erfahrung an der Aussepolitik a gëllt als ee vun de féierende lëtzebuergesche Diplomaten.

Och am Ministère fir Aussebezéiungen an Europäesch Affären zielt hien zu de féierende Perséinlechkeeten an de Beräicher nohalteg Entwécklung, Entwécklungszesummenaarbecht a multilateraler Diplomatie. Et ass bekannt, datt den Ambassadeur Jacques Flies e grousst Interessi un ethesch a moralesche Prinzipien huet.

D'lëtzebuergesch Ambassade a Südkorea ass eng relativ nei Verriedung a besteet eréischt säit manner wéi zwee Joer.

D'Politikvirschléi, déi vun engem koreanesche Biergerdiplomat proposéiert ginn, si vu bedeitendem etheschem Notzen fir Lëtzebuerg a wäerten och d'diplomatesch Relatiounen tëscht Lëtzebuerg a Südkorea staark féerden.

Besonnenesch kann eng akademesch an ethesch Zesummenaarbecht tëscht der Universitét Lëtzebuerg an dem KAIST als eng vun de bedeitendsten diplomatesche Leeschtungen vu Lëtzebuerg gellen.

Dat ass net meng subjektiv Meenung, mee d'Resultat vun enger kontinuéierlecher a präziser Analys iwwer Lëtzebuerg.

Your Excellency,

As this will be my first experience using Microsoft Teams, I beg Your Excellency's kind indulgence for any lack of familiarity with its functions.

From what I have been able to gather, it seems that the mere generation of an invitation link does not yet indicate whether the other participant has joined. Confirmation appears possible only when the profile becomes visible or a first message is exchanged.

In this regard, and should it not cause any inconvenience, I would be most deeply honored if Your Excellency might kindly open the meeting with a greeting at its commencement this afternoon at 2:00 p.m.

Your Excellency, I have prepared with utmost care for our forthcoming discussion.

During the meeting, I shall most respectfully share a ten-minute PDF briefing through the Teams attachment feature. It presents a practical model for implementing an initial MVP (Minimum Viable Product) without external funding—self-sustaining by design, and capable of producing tangible outcomes even under budgetary constraints.

Moreover, I humbly believe that a framework of academic cooperation between the University of Luxembourg and Korean universities, through internships and student exchanges, could yield results of genuine educational and d

iplomatic value.

I had previously established contact with the German Development Agency (GIZ) and the Swedish International Development Cooperation Agency (SIDA); however, both institutions indicated that their operational budgets are currently exhausted.

In retrospect, I realize that my earlier confidence may perhaps have been somewhat over-enthusiastic. Nevertheless, I continue to hold an unwavering faith in the clarity of my insight and the integrity of my intentions. This conviction does not stem from pride, but rather from sustained self-reflection and a profound sense of purpose.

Should this proposal once again not find its place, I shall, with perseverance, continue to engage in further diplomatic outreach across other nations. Yet I must humbly confess that pursuing such endeavours in a purely personal capacity can at times be deeply challenging.

It is therefore my earnest hope that Your Excellency might place a measure of trust in one Korean who speaks with confidence not of himself, but of conviction. Tomorrow, I shall have the honour of presenting to Your Excellency a document that has not been submitted to either GIZ or SIDA. The concept it contains requires such a modest level of resources that financial constraints can no longer serve as an obstacle to its realization.

P.S. – Votre Excellence, M. l'Ambassadeur Jacques Flies,

Le document que j'aurai l'honneur de vous remettre demain compte quarante pages. Il aborde non seulement des aspects relatifs au Luxembourg, mais également une question qui demeure depuis longtemps au cœur des préoccupations de l'Union africaine : celle de la mise en place d'un système d'alerte précoce autonome.

Ce dispositif repose sur une architecture d'une simplicité exemplaire, exigeant un coût minimal pour une efficacité maximale.

Pour des missions ciblées, il peut offrir une efficacité opérationnelle élevée à un coût nettement inférieur à certaines capacités satellitaires ; les hypothèses et calculs figurent en annexe. Concrètement, cela signifie que l'Union africaine pourrait en assurer le fonctionnement de manière indépendante et continue, sans la moindre contrainte budgétaire.

Je sais que le Grand-Duché de Luxembourg attache une importance toute particulière à ses relations diplomatiques avec l'Union africaine, et c'est précisément dans cet esprit de coopération constructive que cette initiative a été conçue.

Veuillez recevoir, Votre Excellence, l'expression de ma très haute considération.

À titre de complément :

Le système d'alerte précoce proposé est extrêmement économique — avec un coût opérationnel d'environ 10–20 dollars par mission et une précision adaptée aux cas d'usage définis (cf. annexe). Grâce à ce coût remarquablement faible, l'Union africaine pourrait le déployer et l'exploiter de manière régulière et autonome.

Si le système s'associe au Mécanisme d'Alerte Précoce de l'Union africaine (CEWS), le Luxembourg pourrait se positionner comme un véritable pont stratégique entre l'Union européenne et l'Afrique.

Grâce à son coût très faible, les risques opérationnels et diplomatiques peuvent être sensiblement réduits et gérés au moyen de pilotes progressifs et d'évaluations intermédiaires.

J'ai omis de le préciser : le système est hautement éthique, tout en respectant pleinement le RGPD (Règlement général sur la protection des données) et le Pacte international relatif aux droits civils et politiques (PIDCP / ICCPR).

Sa structure est extrêmement légère et quasi dépourvue de coûts — environ 10 à 20 dollars par mission. De plus, n'étant pas un dispositif complexe, une équipe d'environ dix étudiants talentueux pourrait réaliser un MVP

fonctionnel en six mois ou moins, sous réserve des périmètres et dépendances définis.

La conversation de demain commencera par la remise d'un document d'environ quarante pages.

I work on a regular schedule — one day of work followed by one day of rest — under a fixed-term employment contract as a staff member at Hanbat National University in Daejeon.

Ainsi, je dispose de suffisamment de temps, et il me suffira simplement que Son Excellence Monsieur l'Ambassadeur Jacques Flies m'accorde un moment selon sa convenance.

L'Université du Luxembourg constitue un partenaire académique naturel pour ce type de coopération.

Étant basé à Daejeon, je bénéficie d'un avantage géographique et pratique qui facilite une coopération effective avec le KAIST pour ce projet.

Par ailleurs, la ville de Daejeon abrite le KAIST (Korea Advanced Institute of Science and Technology), l'une des plus prestigieuses universités technologiques de la République de Corée. Une coopération avec le KAIST aurait une grande portée diplomatique et symbolique.

Résidant moi-même à Daejeon, je pourrais, le cas échéant, assurer un suivi régulier du développement des travaux de recherche au sein du KAIST et en tenir informé Son Excellence l'Ambassadeur Jacques Flies avec le plus grand soin.

La coopération avec le KAIST ne constituerait pas un simple projet de recherche, mais revêtirait une portée diplomatique majeure en tant que mise en œuvre concrète d'une intelligence artificielle éthique. Le KAIST dispose actuellement de peu de liens directs avec les organismes européens de certification en matière d'IA éthique. Ainsi, un partenariat KAIST–Luxembourg pourrait devenir une plateforme de référence pour la validation et la coopération en recherche éthique.

Cet accord ne se limiterait pas à un cadre scientifique ou technologique : il s'agirait d'un modèle de collaboration non militaire et non commerciale, pleinement conforme au RGPD, au Pacte international relatif aux droits civils et politiques (PIDCP / ICCPR) et à la Recommandation de l'UNESCO sur l'éthique de l'intelligence artificielle.

Un tel triptyque associant éthique, diplomatie et technologie serait sans précédent. Sous une initiative internationale telle que « AI for Human Dignity », le moment où le Luxembourg deviendrait le premier signataire marquerait une élévation certaine de son statut diplomatique sur la scène mondiale.

Référence concernant le KAIST

Selon le classement QS World University Rankings 2025, le KAIST (Korea

Advanced Institute of Science and Technology) se situe parmi les soixante meilleures universités du monde et figure dans le Top 5 asiatique.

Dans les domaines de l'ingénierie et des technologies, le KAIST appartient au groupe immédiatement suivant le MIT, Stanford et Cambridge, et il est souvent évalué plus favorablement que l'Université nationale de Séoul, notamment dans les secteurs de l'intelligence artificielle, de la robotique et des semi-conducteurs.

Le KAIST entretient déjà de nombreux partenariats de recherche et programmes d'échange (MoU) avec plusieurs institutions européennes de premier plan, telles que l'ETH Zürich, l'École Polytechnique et l'Université de Cambridge. Une coopération avec l'Université du Luxembourg apparaît ainsi tout à fait naturelle et hautement prometteuse.

Le KAIST aurait de solides raisons d'envisager favorablement un échange académique et éthique avec une université aussi respectée que celle du Grand-Duché de Luxembourg.

Enfin, ai-je confiance en moi ? Oui — car l'éthique et la responsabilité guident notre approche, et les résultats seront vérifiés à l'aide d'indicateurs (KPI) définis à l'avance.

La création d'un cadre légitime pour une collaboration entre l'Université du Luxembourg et le KAIST est en réalité très simple. Le site mcorpai.org, consacré à l'intelligence artificielle éthique, a été entièrement conçu par un seul ressortissant coréen — en seulement dix jours.

Les étudiants de l'Université du Luxembourg et du KAIST ne peuvent qu'être profondément impressionnés : en dix jours à peine, une seule personne a su unir l'éthique, la diplomatie et la technologie au sein d'un même projet.

Avec l'assurance de ma plus haute considération,

Gyu-min Jeon (I was born in 1982.)
Citizen Diplomat of the Republic of Korea
